#### ABSTRACT

Broome Community College (BCC) is developing a series of questionnaires to assess the impact of college on its students, and to measure the college's role, if any, in promoting social mobility. The first study in this series focused on the backgrounds, needs, and goals of students who entered BCC during June, July, and August of 1983. Students who had been admitted to the college for the fall term were asked to come to campus in groups of 30 or less for an all day program of orientation and counseling and to register for classes. All students who participated in the summer program (N=1698) completed a 34-item survey. Survey findings, based on 1686 usable responses, included the following: (1) 86.8% indicated they were first-time, full-time students; (2) 50.1% of the respondents were male, 96.1% were white, 77.0% were under 18 years of age, and 94.0% were single; (3) 54.3% indicated their intention to work either fullor part-time while enrolled; (4) 33.9% indicated that their parents would be their main source of financial support; (5) 7.2% indicated that they had previously attended college; and (6) 85.5% had been admitted to their first-choice program. The study report includes data tables detailing survey responses and the questionnaire. (EJV)

# Broome Community College (BCC) ENTERING STUDENT QUESTIONNAIRE - FALL 1983

## Introduction

These few pages are meant to explain the method used in obtaining data on students in the entering class of Fall, 1983, at Broome Community College (State University of New York). We also note some of the precautions which should be taken in using the survey data in general and certain questions in particular.

Broome Community College is developing a series of questionnaires to assess the impact of the college on its students. One goal is to measure the role, if any, that the college plays in promoting social mobility. The first part of this series will be a survey of entering students' backgrounds, needs, and goals. In 1983, a survey form was developed and tested on the incoming fall class. Following an analysis of the results, questions in the survey will be refined and placed in a mark sense format for use on a regular basis. Additional surveys intended to collect longitudinal information on each student in the initial survey are in the process of being developed and tested. Once completed, the data will be used to analyze the long run impact of the college on a number of outcome variables. In the meantime, data collected at each stage in the process will be reported because it contains descriptive information which is useful to decision makers on campus and researchers interested in the community college. The first such results are reported here.

## Administering the survey

The survey was administered to entering students during the months of June, July, and August of 1983, by trained college counselors under the supervision of the Director of Institutional Research. During this period,

i

asked to come to campus in select groups to register for their classes. Typically this includes an all day program of orientation and counseling where students are organized into groups of 30 or less. It was early in this orientation period that students were asked to fill out the survey form. They were given approximately 45 minutes to complete the 34 questions. All of the students who participated in the summer registration turned in their survey forms and only 12 unusable forms were found among the 1698 received. In addition to the summer sessions, the Office of Institutional Research made the survey form available to new incoming students during the mass registration just before the beginning of classes. This was not a very appropriate setting for conducting the survey and few additional students were captured at this point.

## Survey not representative of entire student body

It is important to note that by administering the questionnaire in the summer months, we captured mainly those students who were fresh out of high school and were intent on enrolling as full-time students. Of the 1686 questionnaires processed, 1463 (86.8%) indicated that they would be full-time students without any previous college experience (first-time, full-time students). While this is an important part of the student population, it does not take account of the part-time students and students taking non-credit courses. (See attached enrollment profile). Given this fact, it would not be wise to make generalizations about the entire student body from this stratified sample.

The first-time, full-time cohort is important, however, if we wish to assess the role of the college on social mobility. It is also the only group for which reliable national data ex sts. This allows us to make direct comparisons between students at this college and those at other 2 and 4-year

colleges around the country. National figures are reported in a series of annual surveys sponsored by the American Council on Education and the Cooperative Institutional Research Program at UCLA, under the direction of Alexander W. Astin. Astin's survey is the most often cited body of information on the characteristics of entering freshmen at American colleges and is the source of many of the generalizations made about the type of students who attend the community college. In order to qualify for inclusion in this data base, colleges must be able to show that they have surveyed at least 50% of their first-time, full-time entering students. The survey at BCC captured 93.7% of this cohort, an unusually high rate for any type of survey.

Aside from taking note of the stratified nature of our sample of the student population, precautions should also be taken in interpreting the following questions:

- 1) Q #16. Some students may not have completed high school at the time of the survey but would have by the time they enrolled at BCC as full-time students.
- 2) Q #'s 19 and 20. Because of its complexity, data on parental occupations is not directly reported. The responses were coded using the standard three-digit U. S. Bureau of Census code. The results are summarized in Part 2, Table 6. The assignment of these occupational codes is often subjective. We have been as careful as possible in the coding process and several factors lead us to believe that errors have been kept to a minimum. The area is geographically small enough so that a large number of the respondents' parents worked for one of the few large industrial employers. The coders were long-time residents of the area and had a personal knowledge of approximately 2% of the families. Another 3% were verified by telephone interviews.

iii

Census codes were then recoded into the occupational prestige scores most often used by sociologists, the Duncan socioeconomic index - SEI. The SEI Index, together with information on parental educational level and income, provides a measure of the social origins of the respondents.

- 3) Q #21. Results on this question are presented in Part 2, List A, which was part of the original survey form. Transfer programs are defined as those degree programs at BCC which are advertised as transfer oriented and which have at least 60% of the graduates transferring to 4-year colleges. On List A, curricula with code numbers 02, 07, 13, 22, 23, and 27 meet this criterion. The rest are classified as non-transfer programs.
- 4) Q #27. BCC has very few certificate or diploma programs. Respondents might have confused the words diploma and degree. If this were true to any significant extent, certain uses of this question would not be reliable.
- 5) Q #33. While student reports of parental educational level and occupation have been found to be highly reliable, student reports of family income are not. We are in the process of checking these reports against the actual tax records submitted by students for financial aid purposes. A separate report will be issued on these response errors. A family income variable was created by adding the mid-points of each income class and using \$40,000 for the open-ended upper-class. Some distortions may result from using this method.

## Survey results

In this report only the frequencies for each question are presented. They are reported on a copy of the actual survey form as the percentage of the respondents choosing that selection. The survey form contains 34 questions, a number of which require multiple responses. In all, 90 usable variables were obtained. One new variable--family income--was created. The

data were compiled using the SPSS computer program. Upon careful examination of an early run of the data, it became evident that two questions (#25 and #32) had a considerable number of keypunch and coding errors which made the frequencies misleading. For this reason the results of these questions have not been reported.

The responses to the other questions have been verified and presented here in two separate parts. Part 1 reports on all of the 1686 usable questionnaires in the data base. The percentages reported include those respondents who did not answer that question or who gave an invalid response. An invalid response has been defined as one which results from no response to the question, a response other than those asked for, or a key punch error. In some cases the no response error has been reported separately from the others. Part 2 reports on only the 1463 first-time, full-time students. The percentages reported, for the most part, exclude invalid responses (missing values) and therefore represent the percentage of students who gave a valid response to that question. Research reports utilizing this data would generally cite the figures presented in Part 2.

The additional tables presented, using the data in Part 2, are a preliminary attempt to compare the entering students at BCC with local demographic data and .irst-time, full-time students at other 2 and 4-year colleges.

## BROOME COMMUNITY COLLEGE

## Profile of students enrolled in credit courses Fall 1983 semester

Total number of students in credit courses	7132*
Total number of full-time students Total number of part-time students	4052* 3080*
Total number of first-time, full-time struents Total number of first-time, full-time students	1562*
included in entering student survey	1463

\* Source: Compilation of Statistical Data Concerning the Community Colleges of the State University of New York. Albany, NY: State University of New York, 1984. These are 3rd week statistics. Earlier enrollment figures do not distinguish between full-time and part-time students. During the first 3 weeks of classes the college lost 40 full-time equivalent students (FTE's). Enrollment in the first week was recorded at 5232 FTE's, and at the end of the third week it was 5192 FTE's. Most students do not drop out completely but switch from full-time to part-time status.

Table 7.0

Parents' Occupational Status (Duncan Socioeconomic Index - SEI)

(%) First-time, Full-time Students by BCC Program Type

$\underline{Father} (n = 1306)$					
SEI scores	<u>Status</u>	<u>A11</u>	Transfer	Non-Transfer	
0.0 to 32.3	Low	31.9	25.7	36.8	
32.4 to 64.7	Middle	48.9	50.9	47.2	
64.8 to 96.0	High	19.2	23.4	16.0	

$\underline{Mother} (n = 846)$						
Transfer	Non-Transfer					
25.4	32.3					
63.3	58.3					
11.2	9.3					
	<u>Transfer</u> 25.4 63.3					

The classical measure of occupational status was developed by 0tis Dudley Duncan. The scores on his socioeconomic index (SEI) ranged from a high of 96 points to a low of zero. Here, we have grouped the status scores into three ranges, low, middle and high. As an example, on the Duncan scale an electrical engineer has a status score of 84.0, banktellers have a score of 52.0 and janitors have a score of 12.7. These fit into our high, middle, and low ranges respectively. Since Duncan's research was based on males, the scores presented here for mothers may be less meaningful than those for fathers.
